

Dima DENISENKO

Java Developer (API Integration/Development, eCommerce, ETL, SOA)

I'm a web developer interested in full-stack, event-driven microservices, DevOps, K8s architecture, and more

I really enjoy building open-source software, specializing in creating RESTful APIs, distributed services, ETL, batch data processing, and cloud-native apps.

Summary:

- 15+ years of professional experience in the IT industry - proficient developer on popular web and backend platforms (Spring Boot, Symfony, Magento, React, etc);
- Domain expertise in e-commerce, finance, retail, and travel industries;
- Consulted global retail, investment companies as an IT industry expert in digital transformation and cloud computing;
- Experienced in building software development, QA/QA Automation, DevOps processes from scratch, and optimizing existing ones;
- Business-oriented: I know how to balance between business needs and tech efforts to maximize the business value;
- I am passionate about sharing some nice and suitable solutions to open source;
- Solid knowledge and hands-on experience in development for the Java platform and related technologies;
- Proficient knowledge of modern PHP, JavaScript, and popular JavaScript-based libraries, and frameworks;
- Experience with Spring, Quarkus, Vaadin, Angular, Zend, and other MVC frameworks;
- Strong understanding of design patterns, OOP, and development methodologies;
- Experienced in software architecture design and development planning, business analysis, and requirements definition;
- Experience in gathering requirements, establishing development goals, estimating tasks and projects;
- Experience with DB abstraction layers (JDBC, Hibernate, JOOQ, + Liquibase, Flyway) and messaging services (Apache Kafka, RabbitMQ, JMS), etc.;
- Experience with different modules of Spring Framework like Web, Webflux, Batch, JDBC, Data Couchbase, REST, Security, Spring Cloud (Task, Gateway, Config, Vault, Sleuth);
- Working experience in building ELT using Spring Boot, Kafka Streams, Apache Camel 4, Mapstruct, Commons HttpClient;
- Designing and implementing various REST APIs using best practices like idempotence, security, content negotiation, HATEOAS, versioning, etc.
- Experience with Kubernetes, OpenShift environments, AWS cloud services like EC2, S3, Cloudfront, EKS, and Fargate, and a capability with Google Cloud Run for multi-cloud;
- Deep understanding and hands-on experience with microservice architecture (autonomy, deployability, load

balancing, fault tolerance, monitoring, etc.);

- Experience with CI/CD (Jenkins, GitLab pipelines, Drone CI, GitHub Actions, etc.);
- Team management skills:
 - project coordination, guidance, planning, and tasks distribution;
 - building development processes as a tech leader, code review, and code audit;
 - team motivation, assistance on team member technical growth;
 - following development methodology and processes (Agile, Scrum, SAFe, Kanban);

Work Experience:

DataArt Solutions, Inc.

Senior Software Developer

2021 – Present

Amadeus IT Group SA

Software Engineer

2016 – 2021

WellCart

Tech Lead/Co-founder

2012 – 2016

Magento

Software Developer

2009 – 2011

Recently Completed Projects:

Complex ETL Engine on Top of Kafka Streams

Client: One of Europe's largest asset managers

Overview: The project's goal was to build, test, and maintain event-driven microservices using the Apache Camel framework, Kafka Streams, and Hibernate.

Languages: Java, PL\SQL

Technologies: Spring Framework (Boot, Data), PostgreSQL, Hibernate, Apache Kafka, Mapstruct, Apache Camel, JUnit, Mockito, Docker (Compose), OpenShift, Jenkins, SonarQube, SpotBugs, PMD, Maven, etc.

Position: Senior Software Developer

Responsibilities:

- Interpreting complex business requirements with investment management specifics;
- Constructing a business rules system from scratch;
- Analyzing, designing, and developing the in-house ETL engine and its modules;
- Migrated 20+ applications from legacy Kubernetes instances to OpenShift 4, improving system scalability and reducing server costs
- Implemented containerization strategies with a variety of Jenkinsfiles, Dockerfiles, podman
- Developed monitoring and logging systems with Prometheus+Grafana+Loki+Promtail
- Keeping compliance with the code quality measurements and industry best practices;
- Documenting of practice, processes, and software;
- Ensuring proper implementation of changes in accordance with agreed Change Management procedures;
- Post live, providing third-line support for the duration of the agreed warranty period.

Product Information Management Solution

Client: Home improvement and gardening retailer

Overview: Enterprise product information management (PIM) software provides a single place to collect, manage, and enrich product information, create a product catalog, and distribute it to sales and eCommerce channels. The solution consists of a set of microservices and has event-driven architecture using a Kafka broker, in combination with REST API endpoints for internal/external consumers, Angular UI for admin proposes, etc. Basically, the application implements event-sourcing & saga design patterns to manage distributed transactions across microservices. Also, a

key point in development is that the application must be ready for a multi-cloud environment, so we have a restricted list of infrastructure tools & instruments.

Languages: Java, PL\SQL, Node, JavaScript, TypeScript

Technologies: Spring Framework (Boot, Security, Data), PostgreSQL, Hibernate, Apache Kafka, Apache Avro, Elasticsearch, Kibana, JUnit, Mockito, WireMock, Docker (Compose), Kubernetes, Jenkins, Helm, Vault, SonarQube, SpotBugs, PMD, Maven, etc.

Position: Software Developer

Responsibilities:

- Designing, implementing, and maintaining Java microservices that follow corporate standards of quality, 12 factors, well-tested by JUnit;
- Correcting assessment of the customer's requirements;
- Ensuring application designs conform to business goals;
- Contributing to all phases of the development lifecycle - writing, testing & reviewing code;
- Preparing and producing releases of software components.

ETL Engine for Processing Hotel Content

Client: Global IT solutions provider in the travel industry

Overview: Internal extract-transform-load tool that ran in batch mode to gather descriptive static content from different sources (like REST APIs, sFTP, SOAP servers), transform it using XQuery and finally load it to the third-party consumer.

Languages: Java, PL\SQL, Node, JavaScript

Technologies: Spring – Core / Batch / MVC / Data, Hibernate, various HTTP/sFTP/SOAP clients, JUnit, Mockito, AssertJ, Kafka, Apache Camel, Karaf, Couchbase, MariaDB, Maven, Consul, Docker, Kubernetes, OpenShift, SonarQube

Position: Software Developer

Responsibilities:

- Data transformation flow design
- Development of backend components
- Data mapping
- Configuring of backend components and connectors
- GDS Hospitality and Rail content integration
- Initiation of web application advancement
- Technical assignment preparation
- Functional testing of web application due technical assignment, testing plans
- Business process analysis, formulation of the automation requirements, process optimization
- Analyze customer solution and service requirements
- Business process documentation

Creating a cloud-native platform from scratch using Java/Spring-stack technologies;

Leading in the technical content of the system/functional/design specifications;

Building an ETL platform on top of the Spring Batch framework;

Developing Java microservices using Spring Boot, Spring Cloud stack (Task, Gateway, Config, Vault, Kubernetes, Sleuth), Hibernate, Postgres, Couchbase, web services technologies such as SOAP & RESTful, Pub/Sub architecture implemented with Apache Kafka.

Developing integrations with many external data providers (via SOAP, REST, sftp file exchange).

Achievements:

- ✓ Enhanced DB indexing, through query optimization
- ✓ Optimized data transformation & export modules, DB level indexing, reduced processing time
- ✓ Designed an observability and logging mechanism, tracked business parameters.
- ✓ Integrated dashboard, 10+ tasks, data processing, and transformation; enhanced process capability.
- ✓ Created entire UI/UX and microservices for the hotel and the train verticals, which are used by over 10+ clients.

B2B Hotel Booking Platform

Client:	Global IT solutions provider in the travel industry
Overview:	The project was a hotel booking solution for business travel – a distributed search engine/aggregator. A content-selling platform offers access to various complimentary hotel service providers in a single reservation environment.
Platform:	Linux/Windows
Languages:	PHP, Go, JavaScript, Java, SQL
Technologies:	MariaDB, Docker, Composer, RabbitMQ, Redis, sockets, streams, ElasticSearch, MongoDB, Memcached, Cassandra, CouchDB, InfluxDB
Position:	Software Developer
Responsibilities:	• Supporting technology versatility and high technical skills; • Software design, technical and architectural solutions; • Developing new features and maintaining existing extensions; • Designing and estimating solutions; • Writing unit tests and working with CI tools; • Developing integrations with many data providers (SOAP, REST, file exchange handling), etc. • Facilitated the transition of 8+ engineers, moved a full-scale project, and increased resource utilisation by 90%. • Led cross-functional cooperation across hospitality, implementation, and leadership teams. • Planned team engagement activities, sprint retrospectives, virtual collaboration with 20+ peers, and over 10 activities.

Skills:

Programming and Markup Languages:

Java 17+, JavaScript/TypeScript, JPQL/SQL, PHP, HTML, CSS, XQuery

Technologies and Frameworks:

Servlets, JSP, JPA, Spring (IoC, Security, Data, REST, MVC, REST Docs, Batch), Hibernate, Jackson Mapper, Velocity, Log4j, Angular13+, Bootstrap, Apache Camel, Apache Karaf, Jackson, MapStruct, Swagger 2, Flyway, Liquibase, Symfony 4+, Zend, Laravel, Kafka (with Avro), RabbitMQ

Databases:

MySQL, PostgreSQL, Couchbase, MongoDB

Database Access:

JDBC, Hibernate, Spring Data, Doctrine ORM

Development Environments:

IntelliJ IDEA, PHPStorm, WebStorm, VSCode

Testing Environments:

JUnit, Mockito, WireMock, Cucumber, Vitest, Cypress, PHPUnit, Mockery

Continuous Integration Systems:

GitHub Actions, Jenkins, Drone, GitLab CI, Travis

Version Control Tools:

Git, SVN

Building Tools: Maven, Gradle, Jenkins, Drone CI, Composer PHP, npm, WebPack
